SERVICES AGREEMENT

3COnyx Platform Development

This Agreement is made on 9 October 2026 between THE DATA FAMILY LTD, a company registered in England and Wales with company number 14455834, whose registered office is at 71-75 Shelton Street, Covent Garden, London, England, WC2H 9JQ (the Supplier), and CUXTOMCANDYCLUB LLC (the Client).

The Data Family Ltd
Supplier
Company number 14455834
nimit@data.family

CUXTOMCANDYCLUB LLC
Client
Attention: Antonio Cadet
ronaldcadet91@gmail.com

The Supplier has completed a technical audit of the Client's existing platform at no charge. This Agreement sets out the work the Supplier will carry out to bring that platform to a state in which it can be operated with real customers and real payments.

This Agreement offers two options. Option A delivers the Platform as an installable web application. Option B delivers everything in Option A together with iPhone and Android applications submitted to both stores. The Client selects one at section 15, immediately before the signatures. Where a provision is marked Option B only, it applies solely if Option B is selected.

Schedule 1 sets out the deliverables in detail and forms part of this Agreement.

1. SCOPE OF WORK

The Supplier will deliver the following. Items 1.1 to 1.14 are included under both options. Items 1.15 and 1.16 are included under Option B only.

Included under both Option A and Option B

1.1 **Migration to Client owned infrastructure.** The Platform is moved from its current build environment onto Amazon Web Services under accounts held in the Client's name, including managed database hosting, application hosting, domain configuration and TLS certificates. Existing data is migrated intact. The Supplier holds no sole copy of any credential at any point.

1.2 **Removal of build platform dependencies.** The Platform's dependencies on its current build environment are replaced so that it runs on standard infrastructure, including direct provider connections for artificial intelligence services and payment processing, and correction of the build configuration so the project runs on any developer machine.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

1.3 **Interface design and prototype.** The Supplier will produce an upgraded visual design for the Platform's interface and present it to the Client as a working front end prototype during week one. The Client provides consolidated feedback on that prototype, the Supplier applies it, and the design is then locked so that the remaining build proceeds against a settled design. On the web Platform, the design retains the existing guided request flow, in which a customer selects a category or describes what they need over a short series of screens and submits it with a single confirmation. This does not add intake forms to the mobile applications. This item is provided at no additional charge.

1.4 **Authentication and record ownership.** A default deny access posture is applied across the Platform's interfaces, with an explicit list of those intended to be public. Record ownership checks are added so an authenticated user can access only their own records. The specific exposures identified in the Supplier's audit are closed, including the member transfer history endpoint, the activity log endpoints and the telemetry ingestion endpoint.

1.5 **Transaction integrity.** Price and platform fee calculation is moved to the server so that values supplied by a purchaser's browser are disregarded. The four conflicting commission rate constants are consolidated into a single configurable rate, and the platform fee is separated from the referral reward so a fee is recorded on every transaction, including transactions with no referring member.

1.6 **Referral chain repair.** Invitation codes are captured at registration, resolved to the inviting member and written to the referral records, so that referral relationships are recorded and the commission engine can locate them. Existing members are backfilled where the inviting member can be determined from available data.

1.7 **Removal of demonstration content and correction of copy.** Interfaces and endpoints that return fabricated data are removed from the live Platform and preserved on a separate branch. On screen copy that describes a capability the Platform does not perform, including verification, certification, coverage, instant offers and rate comparison, is corrected. This includes the Emergency intake screen, which currently states that help has been dispatched: before launch it will state accurately what has happened to the request. Web screens that depend on a service not connected under item 1.9, including the insurance quote screen, which is separate from the Insurance intake at item 1.8, and the vehicle history and rental provider screens, are removed from the live Platform and preserved, or are changed to state accurately that the feature is not yet available.

1.8 **Request routing across seven service categories.** Every request submitted through the Platform's web intake, including its guest flow, is completed so that it reaches a person who acts on it. Each request, including one written in the customer's own words, is classified by artificial intelligence, building on the Platform's existing request handling, into one of seven categories: Buy a Car, Sell or Trade, Service or Repair, Customize, Parts and Accessories, Insurance and Emergency. The appropriate partner is selected from the partner list supplied by the Client under section 6. Where no partner is listed for a category, the request is routed to the Client. The Insurance intake, which currently fails on submission, is corrected. The selected partner is notified by text message and electronic mail and accepts the request, and the customer is notified that it has been accepted. Each request progresses through a defined set of states to completion, with its status visible to both the customer and the partner. Nothing

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

is priced, quoted, dispatched or carried out by the Platform on a request until a person has accepted it. A partner may decline a request, in which case it returns to the Client to reassign. Classification by artificial intelligence will not be correct in every case, and a request routed to the wrong partner is handled through that decline path rather than treated as a defect. For the Customize category, payment is taken through the Platform on completion with the platform fee applied. For the other six categories, any payment or fee between the customer, the partner and the Client is arranged outside the Platform.

Outreach to businesses not on the partner list. Where a request has no partner listed, or the Client chooses to contact a business that is not on the partner list, the Client may enter on the request that business's name and either a United States mobile number or an electronic mail address, or both. The artificial intelligence drafts a message describing what the customer needs. The drafted message does not include the customer's name, telephone number or electronic mail address held in the request's contact details, and the Client is responsible for the content of each message it approves. Once the Client has reviewed, edited if required and approved it, the message is sent by text message, electronic mail or both, according to the details provided, from the Platform's own number and sending address held under the Client's accounts at item 1.9. Replies from the business by text message or electronic mail are received into that request and are visible to the Client, who may write and send further messages, each sent only once the Client has approved it. Where the Platform cannot tell which request a reply relates to, it is attached to the most recent open request on which that business was contacted or, if there is none, held for the Client to assign, and the Client may move any reply to another request. Replies by electronic mail are received on a dedicated subdomain of the Client's domain, so the Client's existing mailboxes are unaffected. Telephone calls to the Platform's number are not answered by the Platform and, at the Client's request, the Supplier configures forwarding to a number the Client nominates. Text messages use the provider's standard opt out handling, and no further opt out mechanism is built. A business contacted under this paragraph does not receive a Platform account, acceptance link or status view. Where it agrees to take the request, the Client records this on the request or adds the business to the partner list and assigns it, and the Client updates the request's status on the business's behalf, with the customer notified as for a partner. Payment through the Platform applies only where a Customize request is accepted by a partner on the partner list who has completed the payment provider's onboarding. Where a provider or carrier declines to approve text messages for this purpose, outreach is delivered by electronic mail only and this is not a defect. Outreach consists of individual messages, each approved by the Client. Automated or scheduled follow ups, sending to several businesses at once, and channels other than text message and electronic mail are changes of scope under section 8. Nothing is sent to a business under this paragraph until the Client has approved it.

1.9 **Third party service connections.** The following services, and only these, are connected using the Client's own accounts: Stripe, connected directly rather than through the current build environment, including subscription billing and payouts to providers through connected accounts; Twilio for text messages, sending and, for outreach under item 1.8, receiving; SendGrid for electronic mail, sending from the Client's own domain and, for outreach under item 1.8, receiving replies; OpenAI, Anthropic and Google Gemini, through the Platform's existing routing across those providers, together with the Platform's existing artificial

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

intelligence assistant; vehicle identification number lookup against the United States National Highway Traffic Safety Administration database; MarketCheck, as described at item 1.10; Smartcar, as described at item 1.11; Google Places; Mapbox; Google sign in; Apple sign in; Checkr, so that the Platform's specialist verification status reflects a real background check; Plaid; DocuSign; Shopify; HyperTrack; Fullpath; Browserbase; Reddit; Namecheap; Redis; PagerDuty; and chain of custody anchoring to the Ethereum Sepolia test network. A service is connected when the Platform's existing code that uses it operates end to end against the live provider using the Client's credentials, and handles the provider being unavailable, rejecting a request or returning an error without breaking the Platform. This includes correcting that existing code where needed. It does not include building new features around a service beyond what the Platform's existing code already does with it, except as item 1.8 provides. Where a service's existing code is aimed at an endpoint or method the provider does not offer, rebuilding it is treated under section 8.

1.10 **Live vehicle inventory search.** The Platform's existing vehicle search on the web is connected to live inventory from the Client's vehicle listing data provider, MarketCheck, replacing the twelve fixed listings it currently returns. The response field mapping is corrected so that listings display their correct make, model, year and dealer details. The search filters, sorting and pagination already present in the Platform are made to operate against live inventory. The displayed market comparison figure, which is presently calculated from each vehicle's own asking price and therefore always shows a saving, is replaced with a figure reflecting a genuine comparison or removed. Under Option B, the equivalent screen in the mobile applications is brought to the same standard.

1.11 **Connected vehicle linking and telemetry.** The missing authorisation callback is built so that a member may complete vehicle linking through Smartcar, per vehicle credentials are stored persistently, and vehicle data comprising odometer, fuel and battery readings is retrieved and written to the Platform's existing telemetry storage. Maintenance alert rules replace the Platform's current fixed maintenance messages. Alerts are delivered to members by text message and electronic mail and, under Option B, also as push notifications in the mobile applications.

1.12 **Paid membership.** Membership plans at distinct prices, a subscription checkout bound to the authenticated member, membership status written to the member record on subscription, change and cancellation, entitlement checks applied to the features the Client nominates, and handling of failed payments and lapsed memberships.

1.13 **Operational readiness.** Automated daily database backups with a restore procedure tested at least once during the engagement, error alerting, the Platform's existing automated test suite configured to run before each deployment, in process state moved to persistent storage, and removal of redundant and duplicated code so the Platform runs more efficiently.

1.14 **Installable web application.** The Platform is delivered as an installable progressive web application, so that a user may add it to the home screen of a mobile device directly from the Client's web address without an application store.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

Option B only

1.15 **Mobile applications for iOS and Android.** The Client's existing mobile application codebase is repaired and completed, including correction of the interface addresses that currently prevent screens from loading, configuration of the application to reach the live Platform, application of the design agreed under item 1.3, the vehicle inventory screen described at item 1.10, and verification on physical iOS and Android hardware. The roadside screen reached from the SOS button is pointed at the request routing described at item 1.8, so that a request made from it reaches a partner as an Emergency request. Screens that depend on a service not connected under item 1.9 are removed from the live applications and preserved, or state accurately that the feature is not yet available. Push notification delivery is completed so that requests under item 1.8 and alerts under item 1.11 reach devices.

1.16 **Application store preparation and submission.** Developer account configuration, application signing, store listing preparation, and submission of both applications to the Apple App Store and the Google Play Store from the Client's developer accounts. Section 4 governs submission and approval.

The deliverables listed above for the selected option, as expanded in Schedule 1, are the complete and finite scope of this Agreement. Anything not listed falls under section 8. The proposal issued to the Client provides background and context, and where that proposal and this Agreement differ, this Agreement governs.

2. NOT INCLUDED

The following are outside the scope of this Agreement.

- **Third party services not named in item 1.9.** Only the services named in item 1.9 are connected as integrations. Any other third party integration is not included, whether or not the Platform's code refers to it, and any that already operate are left as they are. This does not affect the services needed to deliver the other items in section 1, such as hosting, database and domain services under item 1.1, deployment and testing tooling under item 1.13, and, under Option B, push notification and application store services under items 1.15 and 1.16. In particular: InsureMO, HONK, CarTrawler, MOTOR and Predii, whose existing code is aimed at addresses that do not exist and each of which requires a signed commercial agreement with the provider before it can be built; API2Cart, which has no working connection, and RepairPal, which is not in the Platform's code; Alibaba, which appears to be connected to the wrong Alibaba platform, and the Oracle dealer connectors, which cannot be scoped from the code; and Loopit, Spinwheel, Gumloop, ShoutUGC, SocialBlade, HubSpot, TikTok Ads, VinSolutions, DealerSocket, Tekion, Reynolds, CDK, Salesforce, eLead, Ship.cars, RunBuggy, uShip, SEMA Data Co-op and APEXX, which appear in the code by name only, with no working connection. The Supplier will quote for any of these separately under section 8, once the Client holds any agreement it requires.
- **New features around connected services.** Connecting a service under item 1.9 makes the Platform's existing use of it work. It does not include building new customer facing features

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

around it, such as delivery tracking using HyperTrack or banking features using Plaid, beyond what the Platform's existing code already does with that service.

- **Remote engine start and remote engine stop.** The Platform's vehicle data provider offers vehicle locking, unlocking and electric vehicle charge control. Remote engine start is not offered uniformly across supported vehicles, and the Supplier has not been able to confirm its availability. No remote command capability of any kind is included in this Agreement. Should the Client obtain written confirmation from the provider that the capability is available, the Supplier will quote for it separately under section 8.
- **Autonomous artificial intelligence action.** The artificial intelligence at item 1.8 classifies requests and routes them to partners. Beyond classifying and routing, and drafting outreach messages for the Client to approve under item 1.8, it takes no action on a request, and it does not price, quote, negotiate, approve or dispatch on its own. It does not find or select businesses outside the partner list, and does not contact such a business unless the Client has approved the message. It does not place or receive telephone calls, or collect or compare quotes on a customer's behalf. Artificial intelligence interfaces in the Platform that return fabricated output are removed under item 1.7 rather than rebuilt.
- **Payment processing outside the Customize category.** Item 1.8 routes and tracks requests in all seven categories. Payment through the Platform is included for the Customize category only.
- **Storage of vehicle listings.** Listings retrieved under item 1.10 are displayed to the user and are not stored by the Platform. Features which depend on stored listings, including watchlists, saved searches and price alerts against a specific vehicle, are not included.
- **Purchase of a vehicle through the Platform.** Item 1.10 delivers browsing and searching of live inventory, and item 1.8 routes Buy a Car requests to a partner. Neither delivers the ability to complete a vehicle purchase through the Platform, which would require stored listings, a commercial agreement with each selling dealer, agreed pricing, availability and reservation handling, and title, registration and delivery processes, none of which exist in the Platform today.
- **Blockchain anchoring to Ethereum's main network.** Item 1.9 connects anchoring to the Ethereum Sepolia test network only, which carries no commercial or legal weight. Anchoring to Ethereum's main network is not included.
- **Intake forms in the mobile applications.** The mobile applications do not currently contain intake forms for the seven categories at item 1.8. Building them is not included under either option.
- **Refunds, payment disputes and chargebacks.** The Platform is not connected to react automatically to refunds, disputes or chargebacks. These remain visible to the Client through the payment provider's own interface.
- **Rebuilding removed demonstration content.** Interfaces removed under item 1.7 are preserved but are not rebuilt as working features under this Agreement.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

- **Migration or administration of the Client's existing mailboxes.** The Supplier configures the Platform to send electronic mail from the Client's domain, and to receive replies to outreach under item 1.8 on a dedicated subdomain. The Client's existing business mailboxes remain with the Client's current provider and are not migrated, rebuilt or administered by the Supplier.
- **Consent, disclosure and adverse action processes for background checks.** Background checks on individuals are regulated in the United States. The Supplier connects the technical interface at item 1.9 only. Obtaining consent, providing disclosures and handling adverse action determinations are the Client's responsibility and the Supplier does not advise on them.
- **Commercial agreements, account fees and usage charges.** All third party accounts, subscriptions, per unit charges and provider agreements are the Client's, as described at section 7.
- **Under Option A, the mobile applications and store submission.** Items 1.15 and 1.16 and section 4 apply under Option B only. Section 8 sets out how they may be added to Option A.
- **Anything not listed in section 1 or Schedule 1.** Where the Client's own materials, the Platform's existing interfaces or any prior discussion describe functionality not listed in section 1 or Schedule 1, that functionality is not included and falls under section 8.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

3. TIMELINE

The engagement begins on the first working day after the Supplier has received the signed Agreement, the first instalment, and the Client accounts and access listed at section 6. Under Option A the engagement runs for four weeks. Under Option B it runs for five weeks. In both, workstreams run concurrently rather than in sequence.

Option A, four weeks

Stage	Delivered
Week 1	Platform running on Client owned infrastructure at the Client's domain. Default deny access applied and the identified exposures closed. Upgraded interface presented to the Client as a working prototype. Payment, messaging and artificial intelligence services connected.
Week 2	Agreed design applied and locked. Server side price and fee calculation, single commission rate, referral chain repaired, demonstration content removed and copy corrected, including the Emergency intake screen. Reviewable build available to the Client.
Week 3	Request routing working across all seven categories, including the guest flow, with requests classified and sent to partners by text and electronic mail, and the Insurance intake corrected. Approved outreach to businesses outside the partner list working, with replies received into the request. Remaining third party services named at item 1.9 connected. Live vehicle inventory search working.
Week 4	Vehicle linking, telemetry and maintenance alerts working. Membership plans, checkout and entitlement working. Backups and alerting in place, handover and walkthrough.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

Option B, five weeks

Stage	Delivered
Week 1	As Option A week 1. Mobile application repaired and pointed at the Platform.
Week 2	As Option A week 2. Reviewable build available to the Client.
Week 3	As Option A week 3, with live vehicle inventory search working on web and mobile.
Week 4	Vehicle linking, telemetry and maintenance alerts working, with requests and alerts also delivered as push notifications in the mobile applications. Membership plans, checkout and entitlement working.
Week 5	Both applications built, tested on physical hardware and submitted to the Apple App Store and the Google Play Store, with the SOS roadside screen routed to partners. Backups and alerting in place, handover and walkthrough.

Where the Client does not supply an item listed at section 6 within one working day of it being requested, the timeline extends by the period of the delay. Where a third party provider does not issue credentials or grant approval within the engagement period, the affected deliverable is completed once they are received or granted, at no additional charge provided this happens within ninety days of handover, and the remainder of the engagement proceeds unaffected. Credentials received or approvals granted after that period are treated under section 8.

4. APP STORE AND PLAY STORE SUBMISSION

This section applies under Option B only.

- **Preparation and submission.** The Supplier prepares both applications for submission, including signing, versioning, permission declarations and store listing assets, and submits them to the Apple App Store and the Google Play Store on the Client's behalf using the Client's developer accounts.
- **Technical rejection.** Where either store rejects a submission for a technical reason attributable to the Supplier's work, the Supplier will correct it and resubmit at no additional charge, for as many rounds as are required.
- **Commercial rejection.** Where either store rejects a submission for a reason concerning the Client's business model, content, pricing, membership terms or category classification, the Supplier will advise on the response. Any consequent change to the application is a change of scope under section 8.

Approval is decided by Apple and by Google. It is outside the Supplier's control and no approval date can be committed to. The dates in section 3 are dates for submission and handover, not for approval.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

5. FEES AND PAYMENT

The fee for the selected option is fixed for the scope described at section 1 and Schedule 1. There is no hourly or daily charge, and no charge for revisions within that scope.

Option A, $9,300

Instalment	Due	Amount
First instalment	Before work begins	$2,325.00
Second instalment	Start of week 2	$2,325.00
Third instalment	Start of week 3	$2,325.00
Fourth instalment	Start of week 4	$2,325.00
Total		**$9,300.00**

Option B, $12,300

Instalment	Due	Amount
First instalment	Before work begins	$2,460.00
Second instalment	Start of week 2	$2,460.00
Third instalment	Start of week 3	$2,460.00
Fourth instalment	Start of week 4	$2,460.00
Fifth instalment	Start of week 5	$2,460.00
Total		**$12,300.00**

Payment is by bank transfer to the Supplier's United States business account, held in the name of The Data Family. Account details are provided once this Agreement is signed. Each instalment falls due at the start of the week to which it relates, so that the Client has seen the output of each week before paying for the next.

6. CLIENT RESPONSIBILITIES

The Supplier depends on the following. Where any is not provided, section 3 applies.

- **Accounts in the Client's name.** An account for each service named at item 1.9 that requires one, together with Amazon Web Services and managed database hosting, and a wallet in the Client's name for the test network anchoring. Apple sign in requires an Apple Developer account, which is therefore needed under both options. Under Option B, a Google Play

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

Developer account is also needed. The Supplier provides the full list of accounts required at the start of the engagement and will assist with configuration.

- **Provider approvals.** Several providers, including Apple, Plaid, DocuSign and Twilio, review an account before granting live access. For Twilio, the Client's business text messaging registration in the United States must be approved before messages are delivered. That review is carried out by the provider and its timing is outside the Supplier's control. Section 3 applies to any resulting delay.
- **Access without sharing credentials.** The Client opens each account in its own name and adds the Supplier as a team member wherever the provider allows it, so that no password or key needs to be sent. Credentials are not to be sent by text message or electronic mail. Where a provider does not allow team members, the Supplier and the Client configure that account together on a call.
- **Domain and electronic mail access.** Collaborator access to the Client's domain registrar account so the Platform can be reached at the Client's own web address with a valid TLS certificate, and so that the Client's domain can be authenticated for sending Platform electronic mail, and a subdomain configured to receive replies to outreach under item 1.8. Namecheap additionally requires the Platform's server address to be approved on the Client's account.
- **The partner list.** For each of the seven categories at item 1.8, the partners to whom requests should be routed, with a name, mobile number and electronic mail address for each. Each Customize partner also completes the payment provider's onboarding so that payouts can reach them. Required by the start of week two.
- **Consolidated design feedback.** A single consolidated set of feedback on the prototype described at item 1.3, provided within three working days of it being presented, so that the design can be locked and the build proceed.
- **The MarketCheck account and key.** Required by the start of week three, for item 1.10. The account is self service.
- **The commission rate decision.** A single commission rate, expressed as a percentage of transaction value, and whether it is added to the partner's price or taken from it. The Platform does not record vehicle cost and cannot calculate a percentage of profit. Required in week one.
- **The demonstration content decision.** Confirmation of which interfaces described at item 1.7 are to be preserved as future work rather than removed. Required in week one.
- **The membership pricing decision.** Plan names and prices, and confirmation of which features require a paid membership. The Client is also responsible for reconciling the Platform's existing statements that membership is free with any decision to charge for it. Required by the start of week two.
- **Developer account access, under Option B.** Access to the Client's Apple Developer and Google Play Developer accounts at a level permitting submission, so that the Supplier can submit both applications under section 4. Both stores allow a team member to be added for this

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

purpose, so no password is shared and the Client retains ownership of both accounts throughout.

- **Availability.** The Client or a named decision maker contactable within one working day.

7. THIRD-PARTY COSTS

All third party costs are contracted directly between the Client and the provider, are billed to the Client, and are not included in the fee at section 5. These include infrastructure and database hosting, payment processing charges, text message and electronic mail charges, artificial intelligence usage charges, connected vehicle data charges, which are levied per connected vehicle per month and therefore increase as membership grows, MarketCheck listing data charges, which are levied per call, background check charges, which are levied per check, charges from each other provider named at item 1.9, Apple Developer account fees, which are needed under both options because of Apple sign in, and, under Option B, Google Play Developer account fees.

The Supplier will advise on selection and configuration but does not resell, mark up or hold any third party account.

8. CHANGES TO SCOPE

Revisions to the deliverables at section 1 and Schedule 1 are unlimited and carry no charge. A revision is a change to how something already listed works, looks or behaves.

A change of scope is the addition of anything not listed at section 1 or Schedule 1 for the selected option. Changes of scope are agreed in writing before work on them begins, and are quoted separately. The fee at section 5 cannot increase for the scope described at section 1 and Schedule 1.

Where the Client wishes to add work excluded at section 2, including the services section 2 lists as not included, remote vehicle commands, storage of listings, purchase of a vehicle through the Platform or intake forms in the mobile applications, the Supplier will assess and quote for it separately, and no such work begins until the Client has accepted that quotation in writing.

Adding the mobile applications to Option A

Where the Client selects Option A, the mobile applications and store submission described at items 1.15 and 1.16 may be added for a fixed fee of $3,000.00, provided the Client requests this in writing before the Platform is handed over. The engagement is then extended by one week, every provision of this Agreement stated to apply under Option B then applies, and the fee is paid as a single instalment at the start of that week. After handover, adding the mobile applications is quoted separately, because the release setup would need to be repeated.

9. INTELLECTUAL PROPERTY AND HANDOVER

All intellectual property in the work delivered under this Agreement, including source code, database schemas, designs, configuration and documentation, transfers to the Client in full on receipt of the final instalment. The Client's existing platform and data remain the Client's property throughout.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

The Supplier builds using standard open source frameworks and publicly available services. No proprietary framework, wrapper or intermediary layer belonging to the Supplier is introduced, and nothing required to run, host, modify or deploy the software remains with the Supplier. Every account is created in the Client's name and under the Client's control from the outset, and the Supplier at no point holds the only copy of any credential.

On handover the Supplier provides written documentation and a walkthrough session. Should the Client engage another technical team at any point, the Supplier will brief that team at no charge.

10. CONFIDENTIALITY

Each party will keep confidential all non public information disclosed by the other, including source code, business plans, customer data, commercial terms and the findings of the Supplier's audit, and will use it solely for the purposes of this Agreement. This obligation continues for three years after the engagement ends.

On completion or termination the Supplier will delete all credentials and access provided by the Client and confirm in writing that it has done so.

11. WARRANTY AND SUPPORT

The Supplier provides two weeks of support following handover, at no charge, covering the work delivered under section 1 and Schedule 1.

A defect is anything delivered under section 1 or Schedule 1 that does not do what those provisions say it does. Defects are corrected at no charge within the support period. A new request is anything those provisions do not describe, and is treated under section 8. Where it is unclear which applies, the Supplier will confirm in writing which it considers it to be within one working day.

The Supplier does not warrant the availability, accuracy, pricing or continued operation of any third party service, nor the approval of any application store submission.

12. LIMITATION OF LIABILITY

Neither party is liable for indirect or consequential loss, including loss of profit, revenue, data or anticipated savings. The Supplier's total liability under this Agreement is limited to the fees paid by the Client under it.

The Platform is a marketplace that routes customer requests to the Client's partners and retrieves data from connected vehicles. The Client is responsible for the partners to whom requests are routed and the businesses contacted through the Platform under item 1.8, and for how and whether they respond, including to Emergency requests; for the vetting, licensing and insurance status of those partners and businesses and of providers listed on the Platform; for the accuracy of vehicle, pricing and service information published on it; for compliance with the laws governing background checks, marketplace transactions, consumer protection and the handling of personal data in every territory in which the Platform operates; for compliance with the laws and carrier rules governing text messages and electronic mail, including consent, identification and opt out, for every message sent

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

through the Platform, including outreach under item 1.8; and for the terms on which memberships are sold. The Supplier builds the systems the Client specifies and does not advise on, verify or warrant any of these matters.

This Agreement is a commercial document and not legal advice. Each party is responsible for taking its own advice on it.

13. TERMINATION

Either party may terminate this Agreement on fourteen days written notice. On termination the Client pays for all work completed to the date of termination, and the Supplier delivers that work together with all credentials, documentation and access in its possession. Instalments already paid for work not yet performed are refunded.

Sections 9, 10 and 12 survive termination.

14. GENERAL

This Agreement, including Schedule 1 and the option selected at section 15, is the entire agreement between the parties and supersedes all prior discussions, proposals and correspondence. It may be varied only in writing.

The Supplier is an independent contractor and not an employee, partner or agent of the Client. Nothing in this Agreement creates a partnership or joint venture.

Neither party may assign this Agreement without the other's written consent. If any provision is found unenforceable, the remainder continues in force.

This Agreement is governed by the laws of England and Wales, and the courts of England and Wales have exclusive jurisdiction.

SCHEDULE 1

Detailed Deliverables

This Schedule forms part of the Agreement and expands the deliverables listed at section 1. It is written in plain terms so that both parties can agree what is being built. Where this Schedule and section 1 differ, section 1 governs. Anything marked Option B applies only if Option B is selected.

WHAT THE CLIENT WILL BE ABLE TO DO ON COMPLETION

- Run your platform on servers and accounts that belong to you, at your own web address, with an upgraded interface.
- Take a request in any of your seven categories, Buy a Car, Sell or Trade, Service or Repair, Customize, Parts and Accessories, Insurance and Emergency, have the AI work out what is needed and who should handle it, have that person told by text and email, have them accept it, and track it to done. For Customize, take payment with your commission taken automatically.
- Know who invited whom, so your referral network is recorded and commissions can be paid.
- Charge a commission that you set, on every transaction, that a buyer cannot alter.
- Have each of the services listed in part G of this Schedule working properly on your own accounts.
- Let members search live vehicle inventory from MarketCheck rather than a fixed sample.
- Let a member link their real vehicle, see real mileage, fuel and battery readings, and receive maintenance alerts.
- Charge a membership fee, know who has paid, and restrict paid features to paying members.
- Show a specialist as verified because a real background check was run.
- Give members an app they install straight from your website. Under Option B, also apps they download from the Apple App Store and the Google Play Store.
- Sleep through the night knowing the database is backed up and you will be told if something breaks.

DELIVERABLES IN DETAIL

A. Interface and design

- An upgraded visual design across the Platform, presented to you in week one as a working prototype you can click through rather than a static picture.
- One consolidated round of your feedback applied, after which the design is locked so the rest of the build proceeds against a settled design.
- The agreed design applied consistently across the web platform, and under Option B carried into the mobile applications.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

- This work is included at no additional charge.

B. Infrastructure and hosting

- The Platform moved onto Amazon Web Services, in accounts opened in your name, which you own and control from the first day.
- Managed database hosting, so backups, patching and version upgrades are Amazon's responsibility rather than yours.
- Your own web address, with the secure padlock correctly installed.
- All dependencies on the tool the Platform was originally built with removed, so it runs on ordinary infrastructure and any developer can work on it.
- Your existing data carried across intact.

C. Accounts, sign in and security

- Every part of the Platform locked by default, with only the pages that should be public left open.
- Ownership checks so that a signed in member can see only their own records, and never another member's.
- The specific holes found in the audit closed, including the money transfer history that can currently be read by anyone, the activity log, and the vehicle data channel.
- The request limiting that currently protects your sign in page repaired, so it can no longer be bypassed.
- Automatic messages from your payment provider verified as genuine before the Platform acts on them.

D. Your invite network and referrals

- Invitation codes captured at the moment an account is created, rather than checked and discarded as they are today.
- The relationship between the inviting member and the new member written to your records, so you can see who brought whom.
- Existing members reconnected to their inviter wherever that can be determined from your current data.
- Your commission engine able to find a referrer, which today it never can.

E. Money, commission and payouts

- Prices and fees calculated on your server, so a buyer can no longer set their own price or set your commission to zero.
- One commission rate that you choose, replacing the four different rates currently written into the Platform.
- Your platform fee separated from the referral reward, so you earn on every transaction including those where nobody referred the buyer.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

- Every fee recorded against every order, so what you are owed is auditable.
- Payouts to providers through your payment provider's connected accounts, using the payout code already in the Platform.

F. Your seven service categories

- Buy a Car, Sell or Trade, Service or Repair, Customize, Parts and Accessories, Insurance and Emergency all working, rather than saving a request that nobody is ever told about.
- The guest flow on your website routes the same way, so a visitor who has not signed up still reaches the right person.
- The AI reads every request, including the ones where a customer writes in their own words, and works out which category it is and which of your partners should handle it.
- That partner is told by text message and by electronic mail as soon as the request is routed.
- The partner accepts the job, and the customer is told that they have.
- The job moves through each stage to completion, and both sides can see where it stands.
- The AI sorts each request and sends it to a partner. Nothing is priced, quoted or dispatched by the Platform until a person accepts it.
- If a partner declines a request, or the AI sends it to the wrong place, it comes back to you to reassign.
- Where you have no partner for a request, you can enter a business's mobile number, email or both on it. The AI writes the message, you approve it, and it goes out from the Platform's own number and email address. The business's replies come back into that request. Nothing is sent until you approve it.
- Outside your partner list, the AI does not find businesses or contact anyone without your approval. It does not make phone calls, gather or compare quotes, negotiate or send automatic follow ups. Those are separate work under section 8.
- Insurance goes to your brokers, Emergency to your tow partners, Service or Repair to your mechanics and body shops, and Parts and Accessories to your suppliers. If no partner is listed for a category, the request comes to you.
- The Insurance form, which currently fails when a customer submits it, is fixed.
- For Customize, payment is taken through the Platform on completion with your commission applied. For the other six, any payment is arranged between you, your partner and the customer.
- The Emergency intake screen, which currently tells a customer that help has been dispatched, will say accurately what has happened to their request.

G. Third party services

- Connected on your own accounts and working properly: Stripe, Twilio, SendGrid, OpenAI, Anthropic, Google Gemini, VIN lookup, MarketCheck, Smartcar, Google Places, Mapbox,

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

Google sign in, Apple sign in, Checkr, Plaid, DocuSign, Shopify, HyperTrack, Fullpath, Browserbase, Reddit, Namecheap, Redis, PagerDuty, and blockchain anchoring.

- Working properly means the code your Platform already has for each service runs against the real provider on your account, and copes when that provider is down, refuses a request or returns an error, without breaking the rest of your Platform.
- It does not mean building new features around a service, other than receiving outreach replies as described in part F. For example, HyperTrack is connected, but building live delivery tracking for customers is separate work.
- Blockchain anchoring records to an Ethereum test network, not the main network. Moving it to the main network is separate work.
- Any other integration your code mentions is not included. The services needed to host, deploy and run your Platform, and under Option B to send push notifications and publish to the app stores, are part of the work regardless. What is not included covers InsureMO, HONK, CarTrawler, MOTOR, Predii, API2Cart, RepairPal, Alibaba and the Oracle dealer connectors. Section 2 of the Agreement lists the rest.
- Several providers, including Apple, Plaid, DocuSign and Twilio, review an account before allowing live use. Twilio must also approve your business text messaging registration. That review is theirs, and can take time.

H. Vehicle inventory search

- Live inventory from MarketCheck replacing the twelve fixed cars the marketplace returns today.
- The listing details corrected so each car shows its real make, model, year and dealer.
- Your existing filters, make, model, year, price, mileage, ZIP code, radius, sorting and paging, all working against live inventory.
- The market comparison figure fixed. Today it is each car's own asking price multiplied by a number worked out from that car's VIN, which is why every car always appears to be a saving. It will either reflect a real comparison or come out.
- Under Option B, the same on the iPhone and Android apps.
- Listings are shown live and are not stored, so watchlists, saved searches and buying through the platform are not part of this.

I. Your electronic mail and domain

- Collaborator access to your domain registrar so we can point your address at the new Platform and install the secure certificate.
- Your domain authenticated for sending, so notifications from the Platform arrive from your own business domain and are far less likely to be treated as junk.
- Your existing business mailboxes stay exactly where they are with your current provider. We are connecting the Platform's sending, and a separate subdomain for outreach replies, not moving your email.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

J. The installable web application

- A member visits your web address, adds it to their home screen in a couple of taps, and it opens like an app.
- No application store approval is involved, so this is available the day it ships.
- Correct icons and naming so it looks like a real application rather than a browser shortcut.

K. Connected vehicles

- The missing return step built, so that a member can complete the approval and actually link a vehicle. Today this leads to an error page and no vehicle has ever been linked.
- Each member's vehicle connection stored properly, so it survives and does not need redoing.
- Real odometer, fuel and battery readings retrieved and written into the vehicle data storage already built into your Platform.
- Maintenance alert rules that watch real readings, replacing the five fixed messages the Platform currently shows every member.
- Alerts delivered to members by text message and electronic mail, and under Option B also as push notifications in the apps.
- Remote engine start and stop are not included, for the reasons set out at section 2.

L. Paid membership

- Membership plans at prices you set, replacing the current arrangement where all five tiers charge the same amount.
- Sign up tied to the member's account, so a payment is attached to a real person. Today it is not.
- Membership status written to the member's record when they subscribe, change plan, or cancel.
- Checks across the Platform so that paid features are genuinely restricted to paying members. No such check exists today.
- Handling for cards that fail and memberships that lapse, so members are not cut off without warning.

M. Specialist background checks

- Your existing background check interface connected to a live account and verified working.
- Your specialist verification status reflecting a real check rather than a badge.
- Consent, disclosure and adverse action handling remain yours, as section 2 explains.

N. Running it safely

- Automated daily backups of your live database, with a restore we perform at least once so we know it works.
- Alerts to you when something breaks, rather than waiting for a customer to report it.
- The automatic checks already in your Platform configured to run before anything goes live.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

- Information currently held in the server's memory moved into the database, so nothing is lost when the server restarts.
- Redundant and duplicated code removed so the Platform runs lighter and costs less to host.

O. iPhone and Android applications, under Option B only

- Your existing mobile application repaired. It already runs and its sign in handling is stronger than your website's, so it is being completed rather than rebuilt.
- The screens that currently fail to load because they request slightly wrong addresses corrected.
- The application connected to your live Platform, which today it cannot reach at all.
- The SOS roadside screen pointed at your request routing, so a request made from it reaches one of your partners as an Emergency request.
- Screens that rely on a service that is not included, such as rentals, either removed from the live apps and kept, or changed to say the feature is coming.
- Push notifications completed, so requests and alerts reach a phone when the application is closed.
- Tested on physical iPhone and Android hardware, not only in a simulator.
- Developer accounts configured, applications signed, store listings prepared, and both applications submitted from your accounts. Approval itself is decided by Apple and Google, as section 4 explains.
- The apps do not currently have intake forms for the seven categories, and building them is not included.

HOW COMPLETION IS MEASURED

The following define when an item is treated as delivered.

- A feature is delivered when it works against the live database under the correct account, not when the screen appears.
- Anything that stores information is delivered when it survives the server restarting.
- A page is delivered when it refuses a visitor who is not signed in, unless it is deliberately public, and refuses a signed in member who does not own the record.
- The money path is delivered when a price sent from a browser is ignored and the fee recorded matches the rate you chose, on every transaction including one with no referrer.
- Request routing is delivered when a request in each of the seven categories, including one written in the customer's own words and one sent through the guest flow, is classified, reaches a partner listed for that category by text and email with nothing open on their device, can be accepted or declined, the customer is told when it is accepted, and is tracked to completion; and, for Customize, moves money with your fee taken. Where the provider or carrier declines to approve your text messaging registration, routing, alerts and outreach are measured by email only.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

- Outreach is delivered when a message you approve reaches a business that is not on your partner list by text and email from the Platform's own number and address, and a reply by each of text and email appears on the correct request. Where the provider or carrier declines to approve text messages for this purpose, this is measured by email only.
- The Insurance form is delivered when a customer can submit it without an error.
- The Emergency intake screen is delivered when it states accurately what has happened to a request rather than that help has been dispatched.
- A third party service listed in part G of this Schedule is delivered when the Platform's existing code for it works against the live provider using your account, and the Platform keeps working when that provider is unavailable or returns an error.
- Live inventory search is delivered when a search returns vehicles supplied by MarketCheck rather than the fixed twelve, each showing its correct make, model and year, and when the filters, sorting and paging operate against that live data.
- Connected vehicles are delivered when a real member links a real car, real readings arrive, and an alert generated from those readings reaches that member by text or email, and under Option B also as a push notification.
- Membership is delivered when the Platform refuses an unpaid member and allows a paid one, and continues to refuse after a membership lapses.
- Under Option B, the applications are delivered when a real build installs and runs on real iPhone and Android hardware against the live Platform, a request made from the SOS roadside screen reaches a partner, and both applications are submitted to the stores.

WHAT THIS SCHEDULE DOES NOT COVER

Section 2 of the Agreement lists what is excluded. Nothing in this Schedule adds to the scope beyond section 1, and nothing in it removes an exclusion at section 2.

Document ID: C3AB77D0C2E85AAE859055CC53D96B32

15. OPTION SELECTED

The Client selects one option by writing either Option A or Option B in the box below. No other selection is valid. The option written in that box determines the scope at section 1, the timeline at section 3 and the fee at section 5.

Option	Scope	Duration	Fee
Option A	The Platform with the services named at item 1.9 and all seven service categories, delivered as an installable web application. Items 1.1 to 1.14.	4 weeks	$9,300
Option B Recommended	Everything in Option A, plus iPhone and Android applications built in the same run and submitted to both stores. Items 1.1 to 1.16.	5 weeks	$12,300

Option B launches you in both app stores from the outset, with push notifications inside your own app, and builds the applications in the same run rather than as a separate engagement later. Option A may be upgraded to Option B for $3,000 until handover, as set out at section 8.

OPTION SELECTED	Write Option A or Option B

AGREED

This Agreement, including Schedule 1 and the option selected above, is agreed by the parties on the dates shown.
